GSM3148 Ethernet Switch
10/100/1000Mbps Switch

GSM3148

Waters Network Systems' GSM3148 switches deliver reliable intelligent 10/100/1000Base-TX connectivity services from the core to the edge. The GSM3148 models provides the application intelligence, manageability and performance to support IP data, voice and video deployment for today's most demanding LAN applications. Four combo slots are available for either 100Base-FX or 1000BaseSX/LX modules.

Features and Benefits

- **Device management software.** All models incorporate an intuitive, web-based interface used to access the management functions. CLI access is also available.
- **Link Layer Discover Protocol (LLDP).** The GSM3148 supports IEEE 802.1ab standards based discovery protocol and provides vendor-independent device discovery. LLDP not only simplifies switch deployment and location of devices, but it can also be used as a troubleshooting, monitoring and firmware management tool.
- **QoS support.** The GSM3148 includes embedded QoS intelligence to prioritize services such as voice, easily unified deployments and helps ensure consistent network performance for all services.

The voice VLAN capabilities allow any IP phone to be plugged into the IP telephony network and receive an immediate dial tone. The switch will configure the device with network specific VLAN and QoS parameters to simplify voice traffic prioritization.

- **Network security.** The GSM3148 provides 802.1x which enables user authentication for each network access attempt. Port security allows you to limit the number of MAC addresses per port for better control. Static MAC addresses can be defined for each port to ensure only registered workstations are allowed access. By enabling both of these features, you can establish an access mechanism based on user and workstation identities, as well as control the number of access stations.
- **Power savings features.** Green power technology is delivered by the GSM3148 with the Energy Efficient Ethernet (EEE) option. EEE reduces power usage when there is a very low traffic utilization (or no traffic).

EEE works by powering down circuits when there is no traffic, and automatic PoE power shutoff is invoked when a line is down or set with the PoE scheduling function. Embedded intelligence is used to adjust power strength based on cable length.
